Patient Flow

Eliminate Chaos. Maximize Throughput.

A Centralized and Data-Driven Patient Transport Department

Through measuring and tracking all patient flow throughout your hospital, we can:

- Provide adequate staffing when traffic is highest
- Rapidly respond to all transport requests
- Maximize your capacity to care for your patients

What does that mean for you?

Patient throughput is about quick response times. With the proper staffing and technology, we can instantly receive and complete transport requests. This means we can identify and fix bottlenecks and maximize the number of patients you serve.

What does that mean for patients?

Quickly completing transport requests means reduced wait times. More time for clinicians to spend at the bedside means better, more intentional care. The result? A better experience throughout the entire patient journey.

What does that mean for clinicians?

More time with patients. On average, our program gives nearly **7,000 hours** back to nursing staff every year. In other words, your clinicians will spend more time at the bedside caring for patients instead of fulfilling transport needs.

It can also boost surgeon satisfaction. On-time arrivals to preop, on-time departures from recovery, and improved inpatient bed turnaround times can expand the capacity of your OR and increase your ability to accommodate add-on requests. These improvements can help you attract surgeons to your hospital and help drive revenue.
